

CERTIFICATE OF ANALYSIS

Important Note: Centrifuge before opening to ensure complete recovery of vial contents.

Catalog #: R01698 **Lot #:** 8K33321

Description: Influenza A
Influenza A (H1N1)

Source: Embryonated chicken eggs.
Strain: H1N1

Format: Purified, Liquid

Purification: Eggs are infected by the amniotic route, incubated for 72 hours and refrigerated overnight. Amniotic fluids are harvested from live eggs and the embryos are washed in PBS. The suspension was concentrated using cross-flow ultracentrifugation system with 30,000 molecular weight cut off. The concentrate is sonicated and clarified using low speed centrifugation. This preparation contains a high concentration of viral antigens as well as some egg proteins in PBS.

Concentration: Protein: 2.1mg/mL
HA Titer: 40960 HA Units/mL

Buffer: Phosphate Buffered Saline

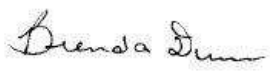

Preservative: None

Application: Suitable for use as a positive control for antigen detection and in ELISA for antibody detection. This antigen preparation should be sonicated with a microtip immediately prior to use to ensure that the preparation is uniform. A precipitate may form upon thawing, due to high product concentration. Dilute prior to clarification or other manipulation. Each laboratory should determine an optimum working titer for use in its particular application. Other applications have not been tested but use in such assays should not necessarily be excluded.

Storage: Store at -70°C to -100°C. Avoid multiple freeze/thaw cycles.

Inactivation: Gamma radiation inactivation. Effectiveness determined when no detection of growth in two blind passages under the original culture conditions. Result: No live virus detected by CPE or HA assay.
This reagent has been inactivated and should contain no infectious material. Generally accepted good laboratory practices appropriate to biological reagents should be employed when handling this product.

Safety Note(s): Refer to the appropriate Safety Data Sheet (SDS) for additional information.
